## 1. APPLICATION

The P43 transducer is a programmable digital instrument destined for the measurement and parameter conversion of 3 or 4 -wire three-phase power networks, in balanced and unbalanced systems.
It ensures the measurement and conversion of measured values into standard analog current signals. Two relay outputs signal the overflow of selected quantities, and the pulse output can be used for the consumption monitoring of the 3-phase active energy.
Quantities measured and calculated by the transducer:

- phase voltages .................................................... $\mathrm{U}_{1}, \mathrm{U}_{2}, \mathrm{U}_{3}$
- phase-to-phase voltages .................................... $\mathrm{U}_{12}, \mathrm{U}_{23}, \mathrm{U}_{31}$
- 3-phase mean voltage ......................................... U
- phase-to-phase mean voltage ............................. UPP
- three-phase mean current.................................... I
- phase currents ................................................... $I_{1}, I_{2}, I_{3}$
- phase active powers ............................................ $P_{1}, P_{2}, P_{3}$
- phase reactive powers ......................................... $Q_{1}, Q_{2}, Q_{3}$
- phase apparent powers ....................................... $\mathrm{S}_{1}, \mathrm{~S}_{2}, \mathrm{~S}_{3}$
- phase active power factors ................................... $\mathrm{Pf}_{1}, \mathrm{Pf}_{2}, \mathrm{Pf}_{3}$
- reactive/active ratio of power factors .................... $\operatorname{tg} \varphi_{1}, \operatorname{tg} \varphi_{2}, \operatorname{tg} \varphi_{3}$
- three-phase mean power factors .......................... Pf, $\operatorname{tg\varphi }$
- three-phase active, reactive and apparent powers ... P, Q, S
- active mean power (e.g. 15 min.).......................... Pav
- three-phase active and reactive energy ................ Ept, Eqt,
- frequency
f
The transducer possesses an archive, in which 1000 last mean power values suitably synchronized with the clock (15, 30 or 60 minutes) are stored.
Maximal and minimal values are measured for all quantities. Additionally, there is the possibility to accommodate the transducer to external measuring transducers. The transducer has a detection and signaling of incorrect phase sequence. The actualization time of all accessible
quantities does not exceed 1 second. All quantities and configuration parameters are accessible through the RS-485 interface and the USB interface.
Transducer output signals are galvanically isolated from the input signal and the supply. Outside the transducer, there are socket-plug

## 2. TRANSDUCER SET

The set of the P43 transducer is composed of:

- P43 transducer
- user's manual

1 pc

- guarantee card

1 pc

- CD disc

CD doc
When unpacking the transducer, please check whether the type and execution code on the data plate correspond to the order.

## 3. BASIC REQUIREMENTS AND OPERATIONAL SAFETY

In the safety service scope, the transducer meets to requirements of the EN 61010-1 standard.

## Observations Concerning the Operational Safety:

- All operations concerning transport, installation, and commissioning as well as maintenance, must be carried out by qualified, skilled personnel, and national regulations for the prevention of accidents must be observed.
- Before switching the transducer on, one must check the correctness of connections to the network.
- Before removing the transducer housing, one must switch the supply off and disconnect measuring circuits.
- The removal of the transducer housing during the guarantee contract period may cause its cancellation.
- The P43 transducer is destined to be installed and used in industrial electromagnetic environment conditions.
- One must remember that in the building installation, a switch or a circuit-breaker should be installed. This switch should be located near the device, easy accessible by the operator, and suitably marked.

## 4. INSTALLATION

### 4.1. Fitting

The P43 transducer is adapted to be mounted on a 35 mm rail acc. to EN 60715.
The overall drawing and the fitting way are presented on the fig.1.

Fig. 1 Overall Dimensions and Transducer Fitting Way.

### 4.2. External Connection Diagrams

Fig. 3. Connection Diagrams of the Transducer in a Four-wire Network

## 5. SERVICE

## Frontal Plate Description

Fig. 4 Frontal view of the P43 transducer

## Messages after Switching the Supply on

After switching the supply on, the state diode should light up for a moment in red, and next should light up in green. The recording confirmation in registers is signaled by a short extinction of the state diode.
The incorrect work is signaled by the state diode in the way described in the chapter 7. The data reception through the RS-485 interface is signaled by a pulsing of the Rx diode. The data transmission through
the RS-485 interface is signaled by a pulsing of the Tx diode.
The switching of the relay 1 on causes the lighting of the AL1 diode, however the switching of the output 2 on causes the lighting of the AL2 diode (fig. 4).

## Installation of COM Port Controllers in the Computer

The P43 transducer makes use of the software, which creates in the system, a device of Universal Serial Bus - P43 transducer of network parameters, and connected to it, the virtual COM port named P43 transducer of network parameters.
The controller installation in the Windows system causes the addition of a successive serial COM port to the list of ports serviced by the operating system.
After connecting the transducer to the USB port, the operating system informs about the appearance of a new device by means of the message presented on the fig. 5.
The creator to find a new hardware of the Universal Serial Bus will be started automatically. One must act in compliance with the creator suggestions, choosing the installation from the indicated location and giving the path to controllers being in the added CD. Controllers are compatible with following systems: Windows 2000, XP, Server 2003, Vista, server 2008, (x86 and X64). When installing controllers, information about the lack of the controller digital signature can occur. One must ignore this information and carry on the installation.

Fig. 5. Message signaling the detection of a new device "Transducer of P43 type".

After closing the creator, the system detect immediately the successive device - USB Serial Port (fig. 6.). The creator for detection a new hardware will start again.

## (1) Found New Hardware $\times$ L'SE Serial Port

Fig. 6. Systemic message concerning the detection of a new device

After the successful ending of the installation, the system will inform about the installation of a new device (fig. 7.). Two new devices appear in the device manager - Transducer P43 and Port COM named: Transducer P43, acc. to the fig. 8.

Fig. 7. Systemic message ending the installation of P43 controllers

Fig. 8. View of the device manager window together with the installed P43 transducer, which the port COM6 is assigned to.

## Transducer Configuration by Means of the LPCon Software

The LPCon software is destined for the configuration of the P43 transducer. One must connect the transducer to the PC computer through the PD10 converter or directly through the USB link and after choosing the Option-> Connection configuration, configure the connection (fig. 9.). For direct connection, through USB: address 1, baud rate $9600 \mathrm{~kb} / \mathrm{s}$, mode RTU 8N2, timeout 1000 ms and the suitable COM port under which the controller of the P43 transducer has been installed or through the RS-485 interface and the PD10 programmer: address, baud rate, and the mode acc. to the installed in the transducer.

Fig. 9. Configuration of the connection with the P43 transducer

After the connection configuration, one must choose from the Device -> Transducers -> P43 menu, and next click the Readout icon in order to read out all parameters. One can also read out parameters individually in each group, clicking the Refresh button. In order to change parameters, one must write the new value in the parameter window and click the Apply button.

## Setting of Transmission Parameters

After choosing the group - transmission parameters, it is possible to configure following elements:
a) address - address for the communication with the P43 transducer through the RS-485 interface from the range $1 . .247$. The value 1 is normally set up by the manufacturer.
b) baud rate - the communication rate through the RS-485 interface from the range (4800, 9600, 19200, 38400 bit/sec.) The value 9600 is set up by the manufacturer.
c) transmission mode - The transmission mode through the RS485 interface from the range (RTU 8N2, RTU 8E1, RTU 801, RTU 8N1). The transmission mode is normally set up on RTU 8N2 by the manufacturer.

Fig. 10. View of the configuration window of transmission parameters

## Setting of Measurement Parameters

After choosing the group: ratios, power synchronization, time, following elements can be configured (fig. 11.):
a) current transformer ratio. The multiplier is used to recalculate the current in the transformer primary side. It is set up on 1 by the manufacturer.
b) voltage transformer ratio. The multiplier is used to recalculate the voltage in the transformer primary side. It is set up on 1 by the manufacturer.
c) way to synchronize the mean power:

- 15 minutes' walking window - mean power PAV will be recalculated for the last 15 minutes, actualized every 15 seconds, i.e. walking window,
- measurement synchronized with the clock every 15, 30 or 60 minutes - mean power PAV will be actualized every 15,30 or 60 minutes synchronized with the external real clock (fig. 12).
It is set up on the walking window by the manufacturer.

Ratio of the current transformer:

Ratio of the voltage transformer:

Wethod of mean power synchronization:

Current time:
walking window 15 min

01:00:00 $\div$

d）current time．Time in the form hh：mm：ss．It is set up on 0：00：00 by the manufacturer（also after the supply decay）．

## Erasing of Watt－hour Meters and Extremal Values After choosing the group：erasing of watt－hour meters and extremal

 Values，following commands are possible to carry out（fig．13）：a）erasing of watt－hour meters．All watt－hour meters of active and reactive energy are erased，
b）erasing of active mean power．The power archive is additio nally erased，the number of measurements is set up on 0 ．
c）erasing of min．and max．values．The currently measured value is copied out to the minimal and maximal value．

「 Erasing of mirn．and max．
Fig．13．View of the window to erase watt－hour meters．

## Setting of alarm parameters

After choosing the group: alarm 1 configuration or alarm 2 configuration, it is possible to configure following alarm parameters (fig. 15):
a) assignment of the alarm output parameter - kind of signal, on which the alarm acc. to the table 1 has to react,
The set of the input quantity for alarms and analog outputs is included in the table 1 . The calculation way is shown in examples in the chapter 9.

| Value in registers 4010, 4015, 4020, 4026 | Kind of quantity | Value for percentage calculation of alarms and output values |
| :---: | :---: | :---: |
| 00 | Lack of quantity /alarm or analog output switched off/ | Lack |
| 01 | Voltage of phase 1 | Un [V] * |
| 02 | Current in the wire of phase L1 | $\ln [\mathrm{A}]$ * |
| 03 | Active power of phase L1 | Un $x \ln \times \cos \left(0^{\circ}\right)[\mathrm{W}]$ * |
| 04 | Reactive power of phase L1 | Un $x \ln x \sin \left(90^{\circ}\right)[\mathrm{var}]$ * |
| 05 | Apparent power of phase L1 | Un $x \ln [\mathrm{VA}]$ * |
| 06 | Coefficient of active power of phase L1 | 1 |
| 07 | Coefficient tg $\varphi$ of phase L1 | 1 |
| 08 | Voltage of phase 2 | Un [V] * |
| 09 | Current in the wire of phase L2 | $\ln [\mathrm{A}]$ * |
| 10 | Active power of phase L2 | Un $x \ln \times \cos \left(0^{\circ}\right)[\mathrm{W}] *$ |
| 11 | Reactive power of phase L2 | Un $x \ln x \sin \left(90^{\circ}\right)[\mathrm{var}]^{*}$ |
| 12 | Apparent power of phase L2 | Un $x \ln [\mathrm{VA}]$ * |
| 13 | Coefficient of active power of phase L2 | 1 |
| 14 | Coefficient tg $\varphi$ of phase L2 | 1 |
| 15 | Voltage of phase 3 | Un [V] * |
| 16 | Current in the wire of phase L3 | In [ A ] * |
| 17 | Active power of phase L3 | Un $x \ln \times \cos \left(0^{\circ}\right)[\mathrm{W}] *$ |
| 18 | Reactive power of phase L3 | Un $x \ln x \sin \left(90^{\circ}\right)[\mathrm{var}]$ * |

| 19 | Apparent power of phase L3 | Un $x \ln$ [VA] * |
| :---: | :---: | :---: |
| 20 | Coefficient of active power of phase L3 | 1 |
| 21 | Coefficient tg $\varphi$ of phase L3 | 1 |
| 22 | 3-phase mean voltage | Un [V] * |
| 23 | 3-phase mean current | $\ln [\mathrm{A}]$ * |
| 24 | 3 -phase active power (P1+P2+P3) | $3 x \operatorname{Un} \times \ln \times \cos \left(0^{\circ}\right)[W] * *$ |
| 25 | 3-phase reactive power (Q1+Q2+Q3) | $3 \times U n \times \ln \times \sin \left(90^{\circ}\right)\left[\mathrm{var}{ }^{\text {* }}\right.$ |
| 26 | 3-phase reactive power (S1+S2+S3) | $3 x$ Un $x$ In [VA] * |
| 27 | Power factor of 3-phase active power | 1 |
| 28 | 3-phase coefficient tg $\varphi$ | 1 |
| 29 | Frequency | 100 [Hz] |
| 30 | Phase-to-phase voltage L1-L2 | $\sqrt{3}$ Un [V] * |
| 31 | Phase-to-phase voltage L2-L3 | $\sqrt{3}$ Un [V] * |
| 32 | Phase-to-phase voltage L3-L1 | $\sqrt{3}$ Un [V] * |
| 33 | Phase-to-phase voltage mean voltage | $\sqrt{3}$ Un [V] * |
| 34 | 15, 30, 60 minutes' 3-phase active power | $3 \times \ln \times \ln \times \cos \left(0^{\circ}\right)[\mathrm{W}]$ * |

* Un, In - Rated values of transducer voltage and current
b) kind of the alarm output operation - choose one from 6 modes n-on, n-off, on, off, h-on and h-off. Working modes have been presented on the fig. 14,
c) lower value of alarm switching - percentage value of the state change of the chosen signal,
d) upper value of alarm switching - percentage value of the state change of the chosen signal,
e) switching delay of the alarm. Delay time in seconds when switching the alarm state
Both alarms are set up in the mode n-on.
Caution! The setup of the value Aoff $\geq$ Aon causes the alarm
switching off.

Exemplary configuration of alarm 1 and 2 is presented on the fig. 15.
a) n-on Alarm

b) n-off

Alarm output

c) on

d) off

Fig. 14. Alarm types: a) n-on, b) n-off c) on d) off.

Other alarm types: h-on - always switched on; h-off - always switched off.

Fig. 15. View of the configuration window of analog output

## Setup of analog output parameters

After choosing the group: output 1 or output 2, it is possible to configure following output parameters:
a) assignment of the parameter to the analog output. Kind of signal, on which the output has to react acc. to the table 1,
b) lower value of the input range. Percentage value of the chosen signal,
c) upper value of the input range. Percentage value of the chosen signal,
d) lower value of the output range. Output signal value in mA,
e) upper value of the output range. Output signal value in mA,
f) working mode of the analog output. Following modes are accessible: normal work lower value, upper value. Both alarms are set up in the normal mode by the manufacturer.

An exemplary configuration of the analog output is presented on the fig. 16.e).

Table 2

| Parameter description | Range/value | Manufacturer value |
| :---: | :---: | :---: |
| Ratio of the current transformer | 1... 10000 | 1 |
| Ratio of the voltage transformer | 1... 4000 | 1.0 |
| Synchronization of the active mean power: | - 15 minutes' walking window (recording in the archive every 15 minutes) <br> - measurement synchronized with the clock every 15 minutes, <br> - measurement synchronized with the clock every 30 minutes, <br> - measurement synchronized with the clock every 60 minutes, | walking window |
| Hour x100 + Minutes | 0:00...23:59 | 0:00 |
| Quantity on the relay output No 1 | 0... 34 (acc. to the table 1) | 24 |
| Output type of the alarm 1 | n-on; n-off; on; off; h-on; h-off; | n-on |
| Lower value of the alarm 1 switching | -120.0...120.0\% | 99.0\% |
| Upper value of the alarm 1 switching | -120.0...120.0\% | 101.0\% |

| Quantity on the relay output No 2 | 0... 34 (acc. to the table 1) | 23 |
| Output type of the alarm 2 | n-on; n-off; on; off; h-on; h-off; | n-on |
| Lower value of the alarm 2 switching | -120.0...120.0\% | 99.0\% |
| Upper value of the alarm 2 switching | -120.0... 120.0\% | 101.0\% |

| Switching delay of the alarm 2 | 0... 300 | 0 |
| :---: | :---: | :---: |
| Quantity on the continuous No 1 | 0... 34 (acc. to the table 1) | 24 |
| Lower value of the input range in \% of the rated range of the input No 1 | -120.0..120.0\% | 0.0\% |
| Upper value of the input range in \% of the rated range of the input No 1 | -120.0..120.0\% | 100.0\% |
| Lower value of the output range of the output No 1 | -20.00...20.00 mA | 4.00 mA |
| Lower value of the output range of the output No 1 | 0.01...20.00 mA | 20.00 mA |
| Manual switching of the analog output 1 on: | normal work, the lower value of the output range No 1is set up the upper value of the output range No 1 is set up. | normal work |
| Quantity on the continuous No 2 | 0... 34 (acc. to the table 1) | 23 |
| Lower value of the input range in \% of the rated range of the input No 2 | -120.0..120.0\% | 0.0\% |
| Upper value of the input range in \% of the rated range of the input No 2 | -120.0..120.0\% | 120.0\% |
| Lower value of the output range of the output No 2 | -20.00..20.00 mA | 0 mA |

| Upper value of the <br> output range of the <br> output No 2 | $0.01 \ldots 20.00 \mathrm{~mA}$ | 20 mA |
| :---: | :---: | :---: |
| Manual switching of the <br> analog output 2: | normal work, <br> the lower value of the output <br> range No 2 is set up, <br> the upper value of the output <br> range No 2 is set up. | normal work |
| Address in the MOD- <br> BUS network | $1 \ldots 247$ | 1 |
| Transmission mode | $8 \mathrm{n} 2,8 \mathrm{e} 1,801,8 \mathrm{n} 1$ | 8 n 2 |
| Baud rate | $4800,9600,19200,38400$ | 9600 |

## Measured Values

After choosing the group: - measured values, all parameters measured by the transducer are displayed in the form of a list (fig. 17.).

| Parameter | Value |
| :---: | :---: |
| Vean mirimal 3-phase voltage | 229.92V |
| Wean maximal 3-phase voltage | 91.98 .44 V |
| Wean minimal 3-phase current | 3197 A |
| Wean maximal 3-phase current | 319.71A |
| Mirimal 3-phase active power | 2204.061 W |
| Waximal 3-phase active power | 8817099 w |
| Winimal 3-phase reactive power | - 6.172 Var |
| Maximal 3-phase reactive power | 1.811 Var |
| Mirimal 3-phase apparent power | 2205.419 vA |
| Maximal 3-phase apparent power | 88225010 VA |
| Mirimal active power factor | 1 |
|  |  |

Fig. 17. View of the window of the measured value group

## Minimal and Maximal Values

After choosing the group: - minimal and maximal values, minimal and maximal values of individual parameters measured by the transducer in the form of a list are displayed (fig. 18.).

| Parameter | Value |
| :---: | :---: |
| Mean minimal 3-phase voltage | 229.92 V |
| Mean maximal 3-phase voltage | 9198.44 V |
| Mearn mirimal 3-phase current | 3197. |
| Mean maximal 3-phase current | 319.71A |
| Mirimal 3-phase active power | 2204.061 W |
| Maximal 3-phase active power | 8817099 W |
| Mirimal 3-phase reactive power | -6.172 Var |
| Maximal 3-phase reactive power | 1.811 Var |
| Mirimal 3-phase apprant power | 2205.419 VA |
| Maximal 3-phase apparent power | 88225010 Va |
| Mirimal active power factor | 1 |
|  |  |

Fig. 18. View of the window of the min. and max. value group

## Archive of power profile

After choosing the group: - archive of power profile, following information is displayed:
archiving frequency - frequency time to store the value of averaged power (sample), number of samples, from which sample to display from the range 1... 961 (fig. 19).

Fig. 19. View of the window of the power profile archive group The detailed description of archive operation is described in chapter 6 .

## Information about the Device

After choosing the group - information about the device, following information is displayed: The device picture, serial number, program version, and a short device description

Factory No: 0809002
Firmware wersion: 0.80

Fig. 20. View of the window of the information about the device group

## 6. Archive - Power Profile

The P43 transducer is equipped with an archive allowing to store up to 1000 measurements of averaged active power. The averaged active power $P_{\text {AV }}$ can be archived with time intervals 15, 30, 60 minutes synchronized with the real time clock ( $0,15,30,45$ minutes - an example for 15 minutes is shown on the fig.11).
In case of work in the mode: 15 minutes' walking window, the archiving is the same as for the 15 minutes' time interval (fig. 12). The archive is available in the form of 1001 registers in the range of addresses 8000-9000.
The number of archived values is in the register 8000, however values (samples) are archived in registers with addresses 8001-9000. Values 1 e 20 are in registers, in which samples are not written yet.
The archive is organized in the shape of a circular buffer. After writing the thousandth value, the next value overwrites the oldest value with the number 1 , and successively the next with the number 2 , etc.
As long as the number of samples does not exceed 1000, the value in the register 8000 indicates the number of archived samples. After exceeding 1000 samples, the number of archived values changes in the range from 1000 to 2000. E.g. the value 1006 in the register 8000 means, that there was more than a thousand of samples and the oldest samples are from the register 8007 to 9000 , next from 8001 to the youngest sample located in the register 8006 .
The change of the current or voltage transformer ratio, real time or the kind of mean power causes the archive erasing.

## 7. Error Codes

After connecting the transducer to the network, messages about errors can appear. Causes of errors are presented below:

- the state diode pulsates in red - lack of calibration or the non-volatile memory is damaged. One must return the transducer to the manufacturer,
- the state diode lights in red - inappropriate work parameters; one must configure the transducer again.
- the state diode pulsate altemately in red and green - error of phase connection sequence; one must interchange the connection of phase L2 with the phase L3.

## 8. Serial Interfaces

### 8.1. RS-485 Interface - Set of Parameters

- identifier
- transducer address
- baud rate
- working mode
- information unit
- maximal response time
- maximal number of bytes during the readout/write:
- implemented functions
- 03 readout of registers,
- 16 write of registers,
- 17 device identifying.

Manufacturer's settings: address 1, baud rate 9600, mode RTU 8N2.

### 8.2. USB Interface - Set of Parameters

- identifier
- transducer address
- baud rate
- working mode
- information unit
- maximal response time
- maximal number of bytes during the readout/write:
- implemented functions
- 03 readout of registers,
- 16 write of registers,
- 17 device identifying.

### 8.3. Register Map of the P43 Transducer

In the P43 transducer, data are located in 16-bit and 32-bit registers. Process variables and transducer parameters are located in the register address space in the way depending on the type of the variable
value type. Bits in 16-bit register are numbered in the way depending on the variable value type. Bits in 16-bit registers are numbered from the younger to the older (b0-b15). 32-bit registers contain numbers of float type in the IEEE-745 standard. Register ranges are set in the table 3. 16-bit registers are presented in the table 4. 32-bit registers are set in tables 5 and 6. Register addresses in tables 3,4,5,6 are physical addresses.

Table 3

| Range of <br> addresses | Type of <br> value | Description |
| :---: | :---: | :--- |
| $1000-3001$ | Float <br> $(2 \times 16$ bits) | Value located in two successive 16-bit <br> registers. Registers contain the same data <br> as 32-bit registers from the area 8000. <br> Registers only for readout. |
| $4000-4044$ | Integer <br> (16 bits) | Value located in one 16-bit register. The <br> table 3 contains the register description. <br> Registers for write and readout. |
| $7000-7121$ | Float <br> (2x16 bits) | Value located in two successive 16-bit <br> registers. Registers contain the same data <br> as 32-bit registers from the area 7500. <br> Registers for readout. |
| $7500-7560$ | Float <br> (32 bits) | Value located in one 32-bit register. The <br> table 4 contains the description of registers. <br> Registers for readout. |
| $8000-9000$ | Float <br> (32 bits) | Value located in one 32-bit register. The ta- <br> ble 6 contains the description of registers. <br> Registers for readout. |

Table 4

| Regi- <br> ster <br> ad- <br> dress | Ope- <br> ra- <br> tions | Range | Description | By <br> De- <br> fault |
| :---: | :---: | :---: | :---: | :---: |
| 4000 | RW | 0 | Reserved | 0 |
| 4001 | RW | 0 | Reserved | 0 |
| 4002 | RW | 0 | Reserved | 0 |
| 4003 | RW | $1 \ldots 10000$ | Current transformer ratio | 1 |
| 4004 | RW | $1 \ldots 40000$ | Voltage transformer ratio $\times 0.1$ | 10 |

| 4005 | RW | 0... 3 | Synchronization of mean active power: <br> 0-15 minutes' walking window (recording synchronized every 15 min with the clock.) <br> 1 - measurement synchronized every 15 min with the clock. <br> 2 - measurement synchronized every 30 min with the clock. <br> 3 - measurement synchronized every 60 min with the clock. | 0 |
| :---: | :---: | :---: | :---: | :---: |

* available from the program version 1.02. In prior versions, registers 4037-4040 include energies from added modules of particular energies.

In parenthesis [ ]: resolution or unit is suitably placed.
Energies are render accessible in hundreds of Watt-hours (Var-hours) in two 16-bit registers and for this reason when recalculating values of each energy from registers, one must divide them by 10, i.e:
Active input energy $=($ value of register. 4034 * $65536+$ value of register 4038) / 10 [kWh]
Active output energy $=$ (value of register. 4045 * $65536+$ value of register 4046) / 10 [kWh]
Reactive inductive energy $=($ value of register 4039 * $65536+$ value of register 4040) / 10 [kVarh]
Reactive capactive energy $=$ (value of register 4047 * $65536+$ value of register 4048) / 10 [kVarh]

Status register:
Bit 15-„1" - damage of non-volatile memory
Bit 14 - „1" - lack of calibration or erroneous calibration
Bit 13 - „1" - error of parameter values
Bit 12 - „1" - error of energy values
Bit 11-„1" - reserved
Bit 10 - current range „0" - 1 A~; 1" - 5 A~

Bit 7 - „1" - the interval of power averaging is not elapsed
Bit 6 - „1" - reserved
Bit 5 - „1" - too low voltage to measure the frequency
Bit 4 - , 1 " - too little voltage of phase C
Bit 3 - , "1" - too little voltage of phase B
Bit 2 - „1" - too little voltage of phase A
Bit 1 - relay output state „2" - On, „0" - off
Bit 0 - relay output state „1" - On, „0" - off

## 9. Examples of P43 Transducer Programming

## Example 1 - Programming an Alarm with Hysteresis

Program the operation of the alarm 1 in such a way, that at the value 250 V of the phase 1 voltage, the alarm will be switched on, however switched off at the value 210 V .
For the rated 230 V execution, one must set up values from the table 7 .
Table 7

| Regi- <br> ster | Value | Meaning |
| :---: | :---: | :--- |
| 4010 | 1 | 1 - voltage of phase 1 |
| 4011 | 0 | $0-n$-on mode |
| 4012 | 913 | $913-91.3 \%$ (percentage value with one place after the <br> decimal point multiplied by 10) of the rated voltage of <br> phase 1-alarm switched off, <br> $(210 \mathrm{~V} / 230 \mathrm{~V}) \times 1000=913$ |
| 4013 | 1087 | $1087-108.7 \%$ (percentage value with one place after <br> the decimal point multiplied by 10) of the rated voltage of <br> phase 1-alarm switched on, <br> $(250 \mathrm{~V} / 230 \mathrm{~V}) \times 1000=1087$ |
| 4014 | 0 | $0-0$ second delay in the alarm switching |

## Example 2 - Programming a Unidirectional Continuous Output

Program the continuous output 1 operation in such a way that, at the value 4 A of the mean three-phase current, the value 20 mA was on the output, however at the value 0 A of the mean three-phase current, the value 4 mA was on the output.
For the rated execution 5 A , one must set values from the table 8.:

Table 8

| Regi- <br> ster | Value | Meaning |
| :---: | :---: | :--- |
| 4020 | 23 | $23-$ mean 3-phase current (I) |
| 4021 | 0 | $0-0.0 \%$ (percentage value with one place after the <br> decimal point multiplied by 10) the lower value of the <br> rated mean 3-phase current, <br> $(0 \mathrm{~A} / 5 \mathrm{~A}) \times 1000=0$ |
| 4022 | 800 | $800-80.0 \%$ (percentage value with one place after the <br> decimal point multiplied by 10) the upper value of the <br> rated mean 3-phase current, <br> $(4 \mathrm{~A} / 5 \mathrm{~A}) \times 1000=800$ |
| 4023 | 400 | $400-4.00 \mathrm{~mA}$ (value in mA with two places after the <br> decimal point multiplied by 100) lower value of the output <br> current |
| 4024 | 2000 | $2000-20.00 \mathrm{~mA}$ (value in mA with two places after <br> the decimal point multiplied by 100) upper value of the <br> output current. <br> $(20.00$ mA $\times 100)=2000$ |
| 4025 | 0 | 0 - normal mode of the continuous output 1 |

## Example 3 - Programming a Bidirectional Continuous Output

Program the continuous output 1 operation in such a way that, at the three-phase power value $3 \times 4 \mathrm{~A} \times 230 \mathrm{~V} \times \cos \left(180^{\circ}\right)=-2760 \mathrm{~W}$, the value -20 mA was on the output, however for the three-phase power value $3 \times 4 \mathrm{~A} \times 230 \mathrm{~V} \times \cos \left(0^{\circ}\right)=2760 \mathrm{~W}$, the value -20 mA was on the output.

For the rated execution $3 \times 5 / 230 \mathrm{~V}$, one must set values from the table 9
Table 9

| Register | Value | Meaning |
| :---: | :---: | :---: |
| 4020 | 24 | 24 - 3-phase power (P) |
| 4021 | -800 | -100 - -100.0\% (percentage value with one place after the decimal point multiplied by 10) the lower value of the rated 3-phase power, $\left(3 \times 4 \mathrm{~A} \times 230 \mathrm{~V} \times \cos \left(180^{\circ}\right) / 3 \times 5 \mathrm{~A} \times 230 \mathrm{~V}\right) \times 1000=-800$ |
| 4022 | 800 | 1000-100.0\% (percentage value with one place after the decimal point multiplied by 10) the upper value of the rated 3-phase power, $\left(3 \times 4 \mathrm{~A} \times 230 \mathrm{~V} \times \cos \left(0^{\circ}\right) / 3 \times 5 \mathrm{~A} \times 230 \mathrm{~V}\right) \times 1000=800$ |
| 4023 | -2000 | $-2000--20.00 \mathrm{~mA}$ (value in mA with two places after thedecimal point multiplied by 100) lower value of the output current. $(20.00 \mathrm{~mA} \times 100)=-2000$ |
| 4024 | 2000 | 2000-20.00 mA (value in mA with two places after the decimal point multiplied by 100) upper value of the output current. $(20.00 \mathrm{~mA} \times 100)=2000$ |
| 4025 | 0 | 0 - normal mode of the continuous output 1 |

5 min.

## Additional errors:

in percentage of the basic error:

- from frequency of input signals < 50\%
- from ambient temperature
changes
< $50 \% / 10^{\circ} \mathrm{C}$
- for THD > 8\%
< 100\%

## Standards Fulfilled by the Meter

## Electromagnetic Compatibility:

- noise immunity
- noise emission
acc. to EN 61000-6-2
acc. to EN 61000-6-4

## Safety Requirements:

According to EN 61010-1 standard

- isolation between circuits basic
- installation category III,
- pollution level 2,
- maximal phase-to-hearth voltage 300 V
- altitude above sea level < 2000 m ,

## 11. EXECUTION CODES

Table 11

| TRANSDUCER | P43 - | X | X | X | XX | X |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current input In: |  |  |  |  |  |  |
| 1 A (X/1) .................................................... 1 |  |  |  |  |  |  |
| 5 A (X/5) .................................................... 2 |  |  |  |  |  |  |
| Voltage input (phase/phase-to-phase) Un: |  |  |  |  |  |  |
| $3 \times 57,7 / 100 \mathrm{~V}$............................................... 1 |  |  |  |  |  |  |
| $3 \times 230 / 400$ V ................................................. 2 |  |  |  |  |  |  |

| without extra quality requirements ......................................... 8 |  |  |  |  |  |  |
| with an extra quality inspection certificate |  |  |  |  |  |  |
| acc. to customer's |  |  |  |  |  |  |

[^0]
## Example of Order:

When ordering please respect successive code numbers.
The code: P43-2 21008 means:
P43 - transducer of network parameters of P43 type
2 - current input In:5A(x/5),
2 - input voltage (phase/phase-to-phase) Un $=3 \times 230 / 400 \mathrm{~V}$,
1 - supply voltage: 85... 253 V a.c./d.c.
00 - standard execution,
8 - execution without extra quality requirements.

## 12. Maintenance and Guarantee

The P43 transducer does not require any periodical maintenance. In case of some incorrect operations:

## After the dispatch date and in the period stated in the guarantee card:

One should return the instrument to the Manufacturer's Quality Inspection Dept. If the instrument has been used in compliance with the instructions, we guarantee to repair it free of charge.
The disassembling of the housing causes the cancellation of the granted guarantee.

## After the guarantee period:

One should turn over the instrument to repair it in a certified service workshop.

Our policy is one of continuous improvement and we reserve the right to make changes in design and specifications of any products as engineering advances or necessity requires and revise the above specifications without notice.

## SALES PROGRAM

- DIGITAL and BARGRAPH PANEL METERS
- MEASURING TRANSDUCERS
- ANALOG PANEL METERS (DIN INSTRUMENTS)
- DIGITAL CLAMP-ON METERS
- INDUSTRIAL PROCESS and POWER CONTROLLERS
- CHART and PAPERLESS RECORDERS
- 1-PHASE and 3-PHASE WATT-HOUR METERS
- LARGE SIZE DISPLAY PANELS
- ELEMENTS OF INTEGRATION SYSTEMS
- ACCESSORIES for MEASURING INSTRUMENTS (SHUNTS)
- CUSTOM-MADE PRODUCTS ACCORDING CUSTOMER'S REQUIREMENTS

## WE ALSO OFFER OUR SERVICES IN THE PRODUCTION OF:

- ALUMINIUM ALLOY PRESSURE CASTINGS
- PRECISION ENGINEERING and THERMOPLASTICS PARTS
- SUBCONTRACTING of ELECTRONIC DEVICES (SMT)
- PRESSURE CASTINGS and OTHER TOOLS

## QUALITY PROCEDURES:

According to ISO 9001 and ISO 14001 international requirements.
All our instruments have CE mark.
For more information, please write to or phone our Export Department
